Description

The present invention relates to carbapenems and in particular to such compounds containing a carboxy substituted bicyclic nitrogen containing ring system. This invention further relates to processes for their preparation, to intermediates in their preparation, to their use as therapeutic agents and to pharmaceutical compositions containing them. The compounds of this invention are antibiotics and can be used in the treatment of any disease that is conventionally treated with antibiotics for example in the treatment of bacterial infection in mammals including humans.

Carbapenems were first isolated from fermentation media in 1974 and were found to have broad spectrum antibacterial activity. Since this discovery substantial investigations have been made into new carbapenem derivatives and many hundreds of patents and scientific papers have been published.

The first, and so far the only, carbapenem to be commercially marketed is imipenem (N-formimidoyl thienamycin). This compound has a broad spectrum of antibacterial activity.

The present invention provides compounds with a broad spectrum of antibacterial activity including both Gram positive and negative, aerobic and anaerobic bacteria. They exhibit good stability to beta-lactamases. In addition representative compounds of this invention exhibit favourable pharmacokinetics.

The carbapenem derivatives referred to herein are named in accordance with the generally accepted semi-systematic nomenclature:

Accordingly the present invention provides a compound of the formula (I)

wherein:

R¹ is 1-hydroxyethyl, 1-fluoroethyl or hydroxymethyl;

R² is hydrogen or C₁₋₄alkyl;

R³ is hydrogen or C₁₋₄alkyl;

P is of the formula:

and one or two of A,B,C,D,E,F,G and H, are nitrogen and the remainder are CH; and P¹ is bonded to the nitrogen of the linking carbamoyl group by a carbon atom, in either ring, is substituted by the carboxy group on a carbon atom, in either ring, and is optionally further substituted, on a carbon atom, in either ring, by up to three substituents

The compounds of the present invention may be formulated as dry powder filled vials, which may contain the compound of the present invention alone or as a dry blended mixture. For example an acidic compound of the present invention may be dry blended with an alkali metal carbonate or bicarbonate. Freeze dried formulations of compounds of the present invention, alone or as a mixture with standard excipients, are possible. Standard excipients include structure formers, cryoprotectants and pH modifiers, such as, mannitol, sorbitol, lactose, glucose, sodium chloride, dextran, sucrose, maltose, gelatin, bovine serum albumin (BSA), glycine, mannose, ribose, polyvinylpyrrolidone (PVP), cellulose derivatives, glutamine, inositol, potassium glutamate, erythritol, serine and other amino acids and buffer agents e.g. disodium hydrogen phosphate and potassium citrate.

In addition to the compounds of the present invention the pharmaceutical composition of this invention may also contain, or be co-administered with, one or more known drugs selected from other clinically useful antibacterial agents (for example other beta-lactams or aminoglycosides), inhibitors of beta-lactamase (for example clavulanic acid), renal tubular blocking agents (e.g. probenecid) and inhibitors of metabolising enzymes (for example inhibitors of dehydropeptidases, for example Z-2-acylamino-3-substituted propenoates such as cilastatin) and *N*-acylated amino acids such as betamipron (also see EP-A-178911).

A preferred pharmaceutical composition of the invention is one suitable for intravenous, subcutaneous or intramuscular injection, for example a sterile injectable composition containing between 1 and 50% w/w of the compound of this invention.

Specific examples of compositions, which are constituted as a 1% solution in water, freeze dried and may be made up by adding 0.9% aqueous sodium chloride solution to give the required concentration, preferably 1mg-10mg/ml, as follows:

Composition 1

Compound of Example 1	50mg
-----------------------	------

Composition 2

Compound of Example 1	50mg
Glycine	31mg

Further specific examples of compositions are as above, but where the compound of example 1 is replaced by any one of examples 2 to 15.

The pharmaceutical compositions of the invention will normally be administered to man in order to combat infections caused by bacteria, in the same general manner as that employed for imipenem due allowance being made in terms of dose levels for the pharmacokinetics of the compound of the present invention relative to the clinical use of imipenem. Thus each patient will receive a daily intravenous, subcutaneous or intramuscular dose of 0.05 to 5g, and preferably 0.1 to 2.5g, of the compound of this invention, the composition being administered 1 to 4 times per day, preferably 1 or 2 times a day. The compounds of the formula (V) are novel and form another aspect of the invention.

In another aspect of the present invention the compounds of the formulae (I) and (V) may be prepared by

a) reacting compounds of the formulae (VI) and (VII):

wherein P¹, R², R¹⁰, R¹¹, R¹², R¹³ and R¹⁸ are as hereinbefore defined, P¹ is optionally substituted hereinbefore
 defined and L is a leaving group, or

b) cyclising a compound of the formula (VIII):

wherein P¹, R², R¹⁰, R¹¹, R¹², R¹³ and R¹⁸ are as hereinbefore defined, P¹ is optionally substituted as hereinbefore
 defined and R¹⁴, R¹⁵ and R¹⁶ are independently selected from C₁₋₆alkoxy, aryloxy, di-C₁₋₆alkylamino and diarylami-
 no or any two of R¹⁴-R¹⁶ represent *o*-phenylenedioxy or one of R¹⁴-R¹⁶ is C₁₋₄alkyl, allyl, benzyl or phenyl and
 the other two values are independently selected from C₁₋₄alkyl, trifluoromethyl or phenyl, wherein any phenyl group
 is optionally substituted with C₁₋₃alkyl or C₁₋₃alkoxy; and wherein any functional group is optionally protected and
 thereafter if necessary:

- (i) removing any protecting groups;
- (ii) forming a pharmaceutically acceptable salt;
- (iii) esterifying to form an *in vivo* hydrolysable ester.

Suitably in the compound of the formula (VI), L is the reactive ester of a hydroxy group such as a sulphonate (for
 example C₁₋₆alkanesulphonyloxy, trifluoromethanesulphonyloxy, benzenesulphonyloxy, toluenesulphonyloxy), a phos-
 phoric ester (for example a diarylphosphoric ester such as diphenylphosphoric ester) or L is a halide (for example
 chloride). In an alternative L is a sulfoxide for example -SOCH=CH-NHCOCH₃ which may be readily displaced.
 Preferably L is diphenylphosphoric ester (-OP(O)(OPh)₂).

Compounds of the formula (VI) and their preparation are well known in the carbapenem literature, for example see
 EP-A-126587, EP-A-160391, EP-A-243686 and EP-A-343499.

The reaction between the compounds of the formulae (VI) and (VII) is typically performed in the presence of a
 base such as an organic amine for example di-isopropylethylamine or an inorganic base for example an alkali metal
 carbonate such as potassium carbonate. The reaction is conveniently performed at a temperature between -25°C and
 ambient. The reaction is generally performed in an organic solvent such as acetonitrile or dimethylformamide. The
 reaction is generally performed in a manner similar to that described in the literature for similar reactions.

The compounds of the formula (VII) are novel and form another aspect of the present invention.

The compounds of the formula (VII) may be prepared by the deprotection of a compound of the formula (IX):

wherein P¹, R¹⁰, R¹² and R¹⁸ are as hereinbefore defined, P¹ is optionally substituted as hereinbefore defined and R¹⁷ is a protecting group, for example C₁₋₆alkanoyl or C₁₋₆alkoxycarbonyl. Preferred values for R¹⁷ are acetyl and *t*-butoxycarbonyl. The compounds of the formula (IX) can be converted to the compounds of the formula (VII) by standard methods of deprotection, for example acetyl groups can be removed by basic hydrolysis in aqueous alkanol, alkanol for example with methylamine in ethanol.

The compounds of the formula (IX) are novel and form another aspect of the present invention.

The compounds of the formula (IX) may be prepared by the reaction of an activated derivative of a compound of the formula (X), which may be formed *in situ*, with a compound of the formula (XI):

wherein P¹, R¹⁰, R¹², R¹⁷ and R¹⁸ are as hereinbefore defined and P¹ is optionally substituted as hereinbefore defined. Activated derivatives of the compound of the formula (X) include acid halides, anhydrides and 'activated' esters such as 1H-benzol-1,2,3-triazol-1-yl, pentafluorophenyl and 2,4,5-trichlorophenyl esters or the benzimidazol-2-yl ester of the thiocarboxylic acid corresponding to (X). The reaction of the compounds of the formulae (X) and (XI) is performed under standard methods, for example in the presence of sulphonyl chloride at ambient temperature.

The compounds of the formulae (X) and (XI) are prepared by standard methods known to the skilled chemist such as the methods of the Examples hereinafter, the methods described in EP-A-126587 or by methods analogous or similar thereto. For example, bicyclic rings of the formula P¹ substituted with a methyl group on a ring carbon atom are converted to compounds of the formula (XI) by oxidating the methyl group to a carboxy group, nitrating the ring to introduce a nitro group and reducing the nitro group to an amino group. The oxidation, nitration and reduction steps involve standard methods known in the art.

Suitably, in the compounds of the formula (VIII), R¹⁴, R¹⁵ and R¹⁶ are independently selected from C₁₋₆ alkoxy such as methoxy, ethoxy, isopropoxy, n-propoxy or n-butoxy; aryloxy such as optionally phenoxy; di-C₁₋₆alkylamino such as dimethylamino or diethylamino; diarylamino such as diphenylamino or any two of R¹⁴-R¹⁶ represent *o*-phenylenedioxy. Preferably each of R¹⁴-R¹⁶ have the same value and are C₁₋₆alkoxy for example methoxy, ethoxy, isopropoxy or *n*-butoxy or are phenoxy.

The compounds of the formula (VIII) are cyclized under conventional conditions known in the art to form compounds of the formula (V). Typical conditions are heating in a substantially inert organic solvent such as toluene, xylene or ethyl acetate at temperatures in the region 60-150°C. Typically the reaction is performed in an atmosphere of nitrogen and is carried out in the presence of a radical scavenger for example hydroquinone.

The compounds of the formula (VIII) may be formed and cyclized *in situ*. The compounds of the formula (VIII) may conveniently be prepared by reacting compounds of the formulae (XII) and (XIII):

15 wherein P¹, R², R¹⁰, R¹¹-R¹⁶, and R¹⁸ are as hereinbefore defined and P¹ is optionally substituted as hereinbefore defined. Suitably the compound of the formula (XIII) is a phosphite or is the functional equivalent of such a compound.

The reaction between the compounds of the formulae (XII) and (XIII) is conveniently performed in an organic solvent such as toluene, xylene, ethyl acetate, chloroform, dichloromethane, acetonitrile or dimethylformamide. Typically the reaction is carried out at an elevated temperature for example 60-150°C.

20 The compounds of the formula (XII) may be prepared by a number of methods known in the art. For example the compounds of the formula (XII) may be prepared by the acylation of a compound of the formula (XIV):

35 wherein P¹, R², R¹⁰, R¹², R¹³, and R¹⁸ are as hereinbefore defined and P¹ is optionally substituted as hereinbefore defined with a compound of the formula (XV):

40 wherein R¹¹ is as hereinbefore defined.

The compounds of the formula (XIV) may be prepared by reacting compounds of the formulae (XVI) and (VII):

wherein R² and R¹³ are as hereinbefore defined. The compounds of the formula (XVI) are known in the art and may be reacted with the compounds of the formula (VII) under conventional acylation methods known in the art.

Compounds of the formulae (VII), (XII) and (XIV) are novel and, as such, form another aspect of this invention.

Antibacterial Activity

The pharmaceutically acceptable carbapenem compounds of the present invention are useful antibacterial agents having a broad spectrum of activity in vitro against standard laboratory microorganisms, both Gram-negative and Gram-positive, which are used to screen for activity against pathogenic bacteria. The antibacterial spectrum and potency of a particular compound may be determined in a standard test system. In particular the carbapenems of the present invention show good stability to beta-lactamases and in general particularly good pharmacokinetics, especially as regards half life. In general compounds show significant improvement over imipenem.

The antibacterial properties of the compounds of the invention may also be demonstrated in vivo in conventional tests.

Carbapenem compounds have generally been found to be relatively non-toxic to warm-blooded animals, and this generalisation holds true for the compounds of the present invention. Compounds representative of the present invention were administered to mice at doses in excess of those required to afford protection against bacterial infections, and no overt toxic symptoms or side effects attributable to the administered compounds were noted.

The following results were obtained for representative compounds on a standard in vitro test system using Diagnostic Sensitivity Test. The antibacterial activity is described in terms of the minimum inhibitory concentration (MIC) determined by the agar-dilution technique with an inoculum size of 10^4 CFU/spot.
